SELF-CONTAINED SYSTEMS

These "Plug and Play" units have become the standard for professionals due to high reliability and easy installation. They are single units, like Through the Wall Systems, but can be installed within 25 feet of the cellar and connected through ductwork.

These versatile plug and play self-contained systems offer maximum flexibility in both design and installation. They also provide cooling capacity for any sized area, whether you're storing in a residential, restaurant or commercial wine cellar. The system can be placed in any indoor location outside the cellar resulting in a quiet cellar with no obtrusive equipment taking up valuable racking space.

Some wine experts debate the importance of humidity for proper wine storage. It can be argued that the relative humidity within a bottle is maintained 100% regardless of the closure used or the orientation of the bottle. However, we believe low humidity can be a problem because it may cause organic corks to dry prematurely. The famous European wine caves naturally maintain humidity at around 60%. We can help you achieve the same environment by adding humidifier functionality to virtually any System.
